CHAPTER 2

Measurements and Calculations

1. measurement

2. “Scientific notation” means we have to put the decimal point after the first significant figure, and then express the order of magnitude of the number as a power of ten. So we want to put the decimal point after the first 2:

\[ 2,421 \rightarrow 2.421 \times 10^{\text{to some power}} \]

To be able to move the decimal point three places to the left in going from 2,421 to 2.421, means I will need a power of 10^3 after the number, where the exponent 3 shows that I moved the decimal point 3 places to the left.

\[ 2,421 \rightarrow 2.421 \times 10^{\text{to some power}} = 2.421 \times 10^3 \]

6. a. negative
    b. zero

7. a. The decimal point must be moved one space to the right, so the exponent is negative; 0.5012 = 5.012 \times 10^{-1}.

b. The decimal point must be moved six spaces to the left, so the exponent is positive; 5,012,000 = 5.012 \times 10^6.
c. The decimal point must be moved six spaces to the right, so the exponent is negative; 
\[0.000005012 = 5.012 \times 10^{-6}.\]

d. The decimal point does not have to be moved, so the exponent is zero; 
\[5.012 = 5.012 \times 10^{0}.\]

e. The decimal point must be moved three spaces to the left, so the exponent is positive; 
\[5012 = 5.012 \times 10^{3}.\]

f. The decimal point must be moved three spaces to the right, so the exponent is negative; 
\[0.005012 = 5.012 \times 10^{-3}.\]

11. To say that scientific notation is in standard form means that you have a number between 1 and 10, followed by an exponential term.

a. The decimal point must be moved 4 spaces to the left, so the exponent will be 4: 
\[9.782 \times 10^{4}\]

b. 42.14 must first be converted to \(4.214 \times 10^{1}\) and then the exponents combined: 
\[4.214 \times 10^{4}\]

c. 0.08214 must first be converted to \(8.214 \times 10^{-2}\) and then the exponents combined: 
\[8.214 \times 10^{-5}\]

d. The decimal point must be moved four spaces to the right, so the exponent will be \(-4\): 
\[3.914 \times 10^{-4}\]
e. The decimal point must be moved two spaces to the left, so the exponent will be 2: 
   \[ 9.271 \times 10^2 \]

g. \[ \frac{(4.32 \times 10^{-5})}{432} = \frac{4.32 \times 10^{-5}}{4.32 \times 10^2} = 1.00 \times 10^{-7} \]
h. \[ \frac{1}{(10^5)(10^{-6})} = 1/(10^{-1}) = 1 \times 10^1 \]

15. mass, kilogram; length, meter; temperature, kelvin

16. The metric system uses prefixes to indicate multiples of the basic SI units. For example, a centimeter is \( \frac{1}{100} \) of a meter; a kilometer is 1000 meters.

17. Since a meter is longer than a yard, the floor will require somewhat more than 25 square yards of linoleum. \[ 25 \text{ m}^2 = 5 \text{ m} \times 5 \text{ m} = 5.47 \text{ yd} \times 5.47 \text{ yd} = 30 \text{ yd}^2 \]

18. Since a pound is 453.6 grams, the 125-g can will be slightly more than \( \frac{1}{4} \) pound.
19. Since a liter is slightly more than a quart, and since 4 quarts make 1 gallon, 48 liters will be approximately 12 gallons.

20. Since 1 inch = 2.54 cm, the nail is approximately an inch long.

21. \[100 \text{ km} \times \frac{1 \text{ mi}}{1.6093 \text{ km}} = 62 \text{ km}\]

22. Since a liter is slightly more than a quart, the 2-liter bottle is larger.

23. \[2 \text{ m} \times \frac{100 \text{ cm}}{1 \text{ m}} = 200 \text{ cm}; \quad 2 \text{ m} \times \frac{100 \text{ cm}}{1 \text{ m}} \times \frac{1 \text{ in}}{2.54 \text{ cm}} = 79 \text{ in} \ (80 \text{ in} \text{ to one significant figure})\]

24. 1.62 m is approximately 5 ft, 4 in. The woman is slightly taller.

   d. micrometers

26. a. centimeter
   b. meter
   c. kilometer

27. a. about 4 liters
   b. about half a liter (500 mL)
   c. about 1/4 of a liter (250 mL)

28. d (the other units would give very large numbers for the distance).

29. When we use a measuring scale to the limit of precision, we estimate between the smallest divisions on the scale: because this is our best estimate, the last significant digit recorded is uncertain.

30. When we use a measuring device with an analog scale, we estimate the reading to 0.1 of the smallest scale divisions on the measuring scale. Since this last reading is decided by the user, not by the divisions on the measuring scale, the final digit of the measurement is uncertain no matter how careful we may be in making the determination.

31. The third figure in the length of the pin is uncertain because the measuring scale of the ruler has tenths as the smallest marked scale division. The length of the pin is given as 2.85 cm (rather than any other number) to indicate that the point of the pin appears to the observer to be halfway between the smallest marked scale divisions.

32. The scale of the ruler shown is only marked to the nearest tenth of a centimeter; writing 2.850 would imply that the scale was marked to the nearest hundredth of a centimeter (and that the zero in the thousandths place had been estimated).
33. a. three  
b. two  
c. two  
d. four  
34. a. three (the relationship is exact)  
b. two (a counting number)  
c. five (  
d. only two since there is no decimal point indicated  
35. increase the preceding digit by 1  
36. It is better to round off only the final answer, and to carry through extra digits in intermediate calculations. If there are enough steps to the calculation, rounding off in each step may lead to a cumulative error in the final answer.  
37. a. $2.55 \times 10^5$  
b. $2.56 \times 10^{-4}$

b. $9.375 \times 10^4$  
c. $8.97 \times 10^{-1}$  
d. $1.00 \times 10^3$  
41. Since the only operations in the calculation are multiplication and division, the number of significant figures is limited by the factor of 0.15 that has only two significant figures.  
42. The total mass would be determined by the number of decimal places available on the readout of the scale/balance. For example, if a balance whose readout is to the nearest 0.01 g were used, the total mass would be reported to the second decimal place. For example $32.05 \text{ g} + 29.15 \text{ g} + 31.09 \text{ g}$ would be reported as $92.29 \text{ g}$ to the second decimal place. For the calculation $44.05 \text{ g} + 33.91 \text{ g}$
g + 48.38 g, the sum would be reported as 126.34 g (a total of five significant figures, but given to the second decimal place).

43. three (based on 2.31 having 3 significant figures)

44. Most calculators would display 0.66666666. If the 2 and 3 were experimentally determined numbers, this quotient would imply far too many significant figures.

Density is a characteristic property, which is always the same for a pure substance.

156.  
   a.  The Mars Climate Orbiter dipped 100 km lower in the Mars atmosphere than was planned. Using the conversion factor between miles and kilometers found inside the cover of this text:

   $$100 \text{ km} \times \frac{1 \text{ mi}}{1.6093 \text{ km}} = 62 \text{ mi}$$

   b.  The aircraft required 22,300 kg of fuel, but only 22,300 lb of fuel was loaded. Using the conversion factor between pounds and kilograms found inside the cover of this text, the amount of fuel required in pounds was:

   $$22,300 \text{ kg} \times \frac{2.2046 \text{ lb}}{1 \text{ kg}} = 49,163 \text{ lb}$$

   Therefore, $(49,163 - 22,300) = 26,863 = 2.69 \times 10^4 \text{ lb}$ additional fuel was needed.

   b.  We can now detect the presence of impurities or contaminants to much lower levels than was possible in the past. Although that may seem helpful, we now have to determine whether these contaminants were always present and are not harmful or if they are something new that we should be concerned about.
